

NutriMoment Production Acceptance Audit

Free and premium recipe discovery, Arabic and English output, health and diet constraints, authenticity, latency, and repeated-scan variety

NOT READY	2 / 8	1 / 8	13 / 50
Launch verdict	Premium scenarios passed	Free scenarios passed	Unique repeated-scan cards

Executive verdict

NutriMoment is not ready for launch claims around reliable health-aware recipe generation. Search coverage exists, Gemini calls succeed, and exact card counts can be produced, but the live pipeline frequently violates cuisine and diet preferences, returns broken instructions, repeats recipes, and can discard every Arabic result after finding hundreds of candidates.

The most serious defect is architectural: downstream quality and localization gates can still convert successful search and successful Gemini editing into zero returned cards. That contradicts the documented fail-open contract.

Scope and test inventory

Area	Measured coverage
Languages	English and Arabic - the only two language values exposed by the app
Access tiers	Free and premium temporary authenticated Firebase users
Live combinations	16 tier scenarios across 8 cuisine/diet/health combinations, plus 3 focused output traces
Rotation	10 identical chicken requests on one persistent free account, 5 cards per request
Static and automated	90 deterministic matrix checks; 210 non-emulator tests; lint; TypeScript
Chrome	Blocked: extension discovery succeeded, but claiming the local app tab repeatedly disconnected after the approved fresh-profile launch

Environment baseline

Check	Measured result	Status
/api/healthz	HTTP 200; AI provider, Firebase Admin, app URL, free photos, premium images, and mock-mode checks OK	PASS
Production env validator	Passed; only optional Firestore DB id, log level, and Replicate model overrides absent	PASS
Static QA matrix	90 pass, 0 warn, 0 fail	PASS
Vitest	210 passed, 37 Firestore-rule tests skipped/failed to initialize because emulator port 8080 was unavailable	WARN
Lint and TypeScript	Both passed	PASS

Live premium matrix

Eight authenticated premium requests completed in 314.3 seconds. Only two scenarios passed. All eight were reported as fallback_ai, rather than a clean source-recipe plus premium editor path.

Scenario	Cards	Cuisine signal	Diet/health	Result
Egyptian heart-aware meat chicken bread	10	10/10 cuisine labels match Egyptian	No detected violations	PASS
Italian vegetarian gluten-free diabetes	7	6/7 cuisine labels match Italian	diet hits: Taameya Sandwich Egyptian -> bread; Mark's Minestrone -> kidney	FAIL
Thai pescatarian dairy-free high blood pressure	9	4/9 cuisine labels match Thai	No detected violations	FAIL
Indian vegan diabetes	10	4/10 cuisine labels match Indian	diet hits: Spicy Chickpeas with Grilled Aubergines -> yogurt	FAIL
Turkish keto dairy-free	9	7/9 cuisine labels match Turkish	diet hits: Ground Beef Casserole -> rice; ground beef Stew -> potato; Keto Cig Kofta -> bulgur; Kousa Mahshi -> rice; Moussaka -> potato	FAIL
Mexican weight-loss gluten-free	9	7/9 cuisine labels match Mexican	diet hits: Baked Chicken with Tomato and Bell Pepper -> tortilla; Chicken with Tomato and Bell Pepper -> bread; Gluten-Free Chicken Cacciatore -> bread; Taameya Sandwich Egyptian -> tortilla; Friggione (Onion and Tomato Relish) -> tortilla; Gluten-Free Chicken Enchiladas -> tortilla	FAIL
Any cuisine seafood produce grains heart-aware	10	7 distinct cuisines for Any-cuisine rotation	No detected violations	PASS
Middle Eastern low-blood-pressure weight-gain	9	9/9 cuisine labels match Middle Eastern	No detected violations	FAIL

Live free matrix

Eight authenticated free requests completed in 227.5 seconds. One passed, one warned, and six failed. Exact count was stronger than premium, but cuisine and diet fidelity were materially worse.

Scenario	Cards	Cuisine signal	Diet/health	Result
Egyptian heart-aware meat chicken bread	10	0/10 cuisine labels match Egyptian	No detected violations	FAIL
Italian vegetarian gluten-free diabetes	10	10/10 cuisine labels match Italian	diet hits: Mark'S Minestrone -> kidney; Bread with tomato (Pappa al Pomodoro) -> bread; Bolognese on a Budget -> couscous; Italian Pasta Salad -> pasta	FAIL
Thai pescatarian dairy-free high blood pressure	10	4/10 cuisine labels match Thai	diet hits: Cajun fish Pasta -> cream	FAIL
Indian vegan diabetes	10	2/10 cuisine labels match Indian	diet hits: Vegetable Salad -> kidney; Nacho Pizza -> cheese; Broiled tomato -> cheese	FAIL
Turkish keto dairy-free	10	0/10 cuisine labels match Turkish	diet hits: Ground Beef Casserole -> rice; Briar Patch Bake -> pasta; Shepherd'S Pie -> potato; Bean Dip -> bean; Glop -> potato; Spanish Rice -> rice; Beef And Bean Casserole -> bean; Lasagna -> noodle; ground beef Stew -> potato; Taco In The beef -> cheese	FAIL
Mexican weight-loss gluten-free	10	2/10 cuisine labels match Mexican	diet hits: Sour Cream Enchiladas -> bread; Italian Pasta Chicken -> pasta; Chicken Enchilada(Microwave) -> tortilla; Baked pasta with Chicken -> pasta; Chicken Alfredo Primavera -> pasta; Shawarma -> bread; health hits: Sour Cream Enchiladas -> cream; Chicken Alfredo Primavera -> alfredo	FAIL
Any cuisine seafood produce grains heart-aware	10	6 distinct cuisines for Any-cuisine rotation	No detected violations	PASS
Middle Eastern low-blood-pressure weight-gain	10	10/10 cuisine labels match Middle Eastern	No detected violations	WARN

Arabic pipeline collapse

Focused request: chicken, tomato, garlic, olive oil; Italian cuisine; high blood pressure, cholesterol, and diabetes; 10 cards; Arabic output.

Metric	Premium	Free
HTTP status	200	200
End-to-end latency	67.8 s	45.3 s
Search candidates	426	426
Gemini started / succeeded / failed	10 / 10 / 0	6 / 6 / 0
Cards returned	0 of 10	0 of 10
Generation status	PARTIAL_RESULTS	PARTIAL_RESULTS

The quality gate is the exact function boundary that reduces candidates to zero. The dominant reasons were Arabic English-leakage detection, localization acceptance, pending-image acceptance, generic step quality, and false ingredient-usage failures for garlic and olive oil. Premium completed 10 of 10 Gemini edits successfully before returning zero cards. Free unexpectedly invoked Gemini six times after search had already found compatible recipes.

This violates two product contracts: a post-search enhancement failure must fail open to the last valid source recipe, and free-tier source discovery should not create unnecessary Gemini cost when compatible candidates exist.

English premium culinary audit

The focused English request returned 10 cards in 44.3 seconds. The strict reviewer average was 32.5/100, and 0 of 10 cards met the 85-point acceptance threshold.

Returned card	Score	Reviewer finding
Tomato Basil Chicken Skillet	54	Recognizable, but repetitive health prose and weak preparation detail.
Baked pasta with Chicken	16	Pasta is missing; oil is treated as the main cooked ingredient.
Chicken Cacciatore	58	Closest Italian chicken card, but nutrition and adaptation text are inconsistent.
American Marinara Sauce I	12	Not a chicken dish; corrupted ingredient phrase and no coherent plate.
Chicken Molokhia	30	Egyptian dish returned for Italian cuisine; workflow is heavily rewritten.
Basic Spicy tomato	10	Not a chicken recipe and lacks a complete cooking workflow.
Crushed tomato (Health Adapted)	20	A sauce, not the requested chicken plate; repeated text corruption.
Bread with tomato (Pappa al Pomodoro)	65	Dish identity is authentic, but it ignores chicken and nutrition is implausible.
Roast chicken with tomato	22	Wrong cuisine and generic skillet timing for a roast.
Roasted chicken with tomato and garlic	38	Usable roast outline, but wrong cuisine and unrelated creamy finish.

Measured defects: 3 of 10 cuisine labels were not Italian; 4 of 10 cards did not contain chicken; 42 health-adaptation boilerplate steps were appended; 6 cards contained corrupted 'seasoning-free seasoning' text; only 1 card carried a source URL; and only 4 carried an image URL in the API response.

Authenticity comparison

La Cucina Italiana describes chicken cacciatora as a soffritto-led chicken dish with a slow tomato or wine-based finish. The app version uses generic 'herbs' and 'spices,' repeats adaptation prose, and reports nutrition inconsistent with its listed ingredients. La Cucina Italiana's pappa al pomodoro confirms the returned bread-tomato-basil identity, but that otherwise authentic dish is not a chicken recommendation and its app nutrition claims 20 g protein without a credible protein source.

Ten-scan variety and latency

Metric	Measured	Target	Result
Cards returned	50	50	PASS
Unique cards	13	50	FAIL
Repeated title families	10	0 before scan 10	FAIL
Average latency	9.99 s	under 8 s free source-only	FAIL
p50 latency	10.00 s	under 8 s	FAIL
p95 latency	11.07 s	under 8 s	FAIL

Only 13 unique titles appeared across 50 cards. Chicken Casserole and Vegetable Chicken Pot Pie dominated the rotation; Honey-Mustard Chicken, Lemon Chicken, Baked Chicken and Broccoli, Chicken A La King, and several others repeated. Every run was served from `recipe_reference`.

Usability and Chrome status

A fresh Chrome window was opened in the extension's selected profile after explicit approval. Chrome, the extension, and native-host checks all passed. Tab discovery worked intermittently, but claiming the NutriMoment dashboard repeatedly disconnected the extension. Per the Chrome-control safety contract, testing was not silently moved to another browser.

Therefore this report does not claim fresh evidence for click ergonomics, responsive layout, RTL visual alignment, card expansion, image rendering, history navigation, or premium-gate usability. Those checks remain required after the ChatGPT Chrome Extension connection is repaired or reinstalled.

Acceptance gates

Gate	Target	Measured	Result
Allergen and diet safety	100%	Live violations in 5 premium and 5 free constrained scenarios	FAIL
Arabic language delivery	100% complete cards	0 of 10 returned in both focused tier tests	FAIL
Exact card count	at least 95%	Premium underfilled 5 of 8; free exact in 8 of 8; Arabic 0 of 10	FAIL
Selected cuisine compliance	at least 90%	Frequent cross-cuisine leakage; several scenarios below 50%	FAIL
Culinary acceptance	at least 85/100	Focused English average 32.5/100	FAIL
Ten-scan rotation	50 unique cards	13 unique cards	FAIL
Premium p95	under 20 s	Focused English 44.3 s; Arabic 67.8 s	FAIL
Chrome usability	Complete	Blocked by extension connection	WARN

Prioritized defect register

Priority	Defect	Evidence	Required correction
P0	Post-search gates erase all Arabic results	426 candidates; all Gemini edits succeeded; 0 cards	Return last valid source card when localization, image, or non-safety validation fails
P0	Diet-incompatible recipes reach live responses	Vegan yogurt/cheese, keto rice/pasta/bulgur/potato, gluten conflicts	Make allergen/diet validation authoritative immediately before response and backfill safely
P1	Premium editor output is broken	42 repeated adaptation steps; malformed ingredients and timing	Reject boilerplate mutation, preserve source steps, and validate semantic nutrition before accepting edit
P1	Cuisine selection leaks	Thai, Indian, Mexican, Turkish, and Italian requests returned unrelated cuisines	Do not broaden cuisine fallback while enough selected-cuisine candidates remain
P1	Free path invokes Gemini after valid search	Six successful Gemini calls in focused free Arabic trace	Stop at source result for free tier; treat downstream quality repair as fail-open
P1	Rotation window does not work	13 unique of 50	Persist normalized dish-family exclusions per user/signature for ten scans
P2	Latency exceeds targets	44-68 s focused requests; free p95 11.1 s	Remove repeated fallback branches and prevent successful candidates from re-entering editor loops
P2	Weak recipe and image provenance	1 source URL and 4 image URLs in focused ten-card API response	Require source provenance and resolve image asynchronously without rejecting cards

Recommended remediation order

1. Fix fail-open delivery at quality_gate: image_pending, localization formatting, and other non-safety concerns must never erase a valid search result.
2. Place the final allergen/diet gate after every edit/repair and before response; backfill only from candidates that pass the same gate.
3. Stop generic health boilerplate injection. Health adaptation must modify exact ingredients, quantities, and source steps without appending repeated prose.
4. Enforce selected-cuisine inventory before broad fallback and require the primary requested protein in every selected card unless the UI explicitly permits supporting dishes.
5. Implement the ten-scan exclusion key on normalized recipe and dish-family identity, then rerun the 50-card acceptance test.
6. Repair the Chrome extension connection and complete fresh desktop/mobile English/Arabic usability, image, provenance, and RTL checks.
